### PER CENT OF DEATHS FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY AND CONTRIBUTORY CAUSES.

DIAGRAM 1.—Indiana, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	15
DIAGRAM 2.—Indiana, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	15
DIAGRAM 3.—Indiana, rural, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	15
DIAGRAM 4.—Indiana, rural, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	16
DIAGRAM 5.—Indianapolis, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	16
DIAGRAM 6.—Indianapolis, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	16
DIAGRAM 7.—Kansas, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	17
DIAGRAM 8.—Kansas, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	17
DIAGRAM 9.—Kansas, rural, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	17
DIAGRAM 10.—Kansas, rural, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	18
DIAGRAM 11.—Philadelphia, males: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	18
DIAGRAM 12.—Philadelphia, females: Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes, for the period Sept. 1 to Dec. 31, 1918.....	18

### ANNUAL DEATH RATE PER 100,000 ESTIMATED POPULATION, FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY AND CONTRIBUTORY CAUSES AND FROM ALL OTHER CAUSES.

DIAGRAM 13.—Indiana, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	19
DIAGRAM 14.—Indiana, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	19
DIAGRAM 15.—Indiana, rural, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	20
DIAGRAM 16.—Indiana, rural, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	20
DIAGRAM 17.—Indianapolis, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	20
DIAGRAM 18.—Indianapolis, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	21
DIAGRAM 19.—Kansas, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	21
DIAGRAM 20.—Kansas, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	21
DIAGRAM 21.—Kansas, rural, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	22
DIAGRAM 22.—Kansas, rural, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	22
DIAGRAM 23.—Philadelphia, males: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	23
DIAGRAM 24.—Philadelphia, females: Annual death rate per 100,000 estimated population, from influenza and pneumonia (all forms) as primary and contributory causes and from all other causes, for the period Sept. 1 to Dec. 31, 1918.....	24

## DIAGRAMS—CONTINUED.

## NUMBER OF DEATHS FROM ALL CAUSES AND FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY CAUSES.

	Page.
DIAGRAM 25.—Indiana, males: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	25
DIAGRAM 26.—Indiana, females: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	25
DIAGRAM 27.—Kansas, males: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	26
DIAGRAM 28.—Kansas, females: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	26
DIAGRAM 29.—Philadelphia, males: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	27
DIAGRAM 30.—Philadelphia, females: Number of deaths from all causes and from influenza and pneumonia (all forms) as primary causes, for each day from Sept. 1 to Dec. 31, 1918.....	27

## PER CENT OF DEATHS OF SINGLE AND MARRIED FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY CAUSES.

DIAGRAM 31.—Indiana, males: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	28
DIAGRAM 32.—Indiana, females: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	28
DIAGRAM 33.—Kansas, males: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	29
DIAGRAM 34.—Kansas, females: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	29
DIAGRAM 35.—Philadelphia, males: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	30
DIAGRAM 36.—Philadelphia, females: Per cent of deaths of single and married from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	30

## ROUGH ANNUAL DEATH RATES FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY CAUSES, BY COUNTRY OF BIRTH OF MOTHER.

## ANNUAL DEATH RATE PER 100,000 ESTIMATED POPULATION OF TOTAL AND COLORED FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY CAUSES.

DIAGRAM 39.—Philadelphia, males: Annual death rate per 100,000 estimated population of total and colored from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	32
DIAGRAM 40.—Philadelphia, females: Annual death rate per 100,000 estimated population of total and colored from influenza and pneumonia (all forms) as primary causes, for the period Sept. 1 to Dec. 31, 1918.....	32

## TABLES.

TABLE 1.—Deaths, by sex and age, from all causes and from influenza and pneumonia (all forms) as primary and contributory causes, in Indiana, Kansas, and Philadelphia, for each month from September to December, 1918.....	34
TABLE 1A.—Per cent of deaths from influenza and pneumonia (all forms) as primary and contributory causes to total deaths, by sex and age, and the annual death rate per 100,000 estimated population in Indiana, Kansas, and Philadelphia, for each month from September to December, 1918.....	102
TABLE 2.—Number and per cent of deaths, by sex, from all causes and from influenza and pneumonia (all forms) as primary and contributory causes, in Indiana, Kansas, and Philadelphia, for each day from Sept. 1 to Dec. 31, 1918.....	152
TABLE 3.—Number and per cent of deaths, by sex, age, and conjugal condition, from all causes and from influenza and pneumonia (all forms) as primary and contributory causes, in Indiana, Kansas, and Philadelphia, for the period Sept. 1 to Dec. 31, 1918.....	160
TABLE 4.—Number and per cent of deaths, by sex and age, and for whites, by country of birth of mother, from all causes and from influenza and pneumonia (all forms) as primary and contributory causes, in Philadelphia, for the period Sept. 1 to Dec. 31, 1918.....	162
TABLE 5.—Number and per cent of deaths of males, by age, engaged in specified occupations, from all causes and from influenza and pneumonia (all forms) as primary and contributory causes, in Indiana, Kansas, and Philadelphia, for the period Sept. 1 to Dec. 31, 1918.....	167
TABLE 6.—Number of stillbirths, by month, with color and age of mother, and for whites, by country of birth of mother, in Indiana, Kansas, and Philadelphia: 1918.....	177

## LETTER OF TRANSMITTAL.

---

DEPARTMENT OF COMMERCE,  
BUREAU OF THE CENSUS,  
*Washington, D. C., September 30, 1919.*

SIR:

Special tables of mortality from influenza and pneumonia (all forms) in September, October, November, and December, 1918, for the states of Indiana and Kansas and for the city of Philadelphia are herewith transmitted. Corresponding data for other parts of the registration area for deaths have been partially compiled and it is hoped to publish them at a later date.

Acknowledgment and thanks are given to the United States Public Health Service, which made available from its influenza fund \$20,000 for this statistical study.

These tables have been prepared under the supervision of Dr. William H. Davis, chief statistician for vital statistics, assisted by Mr. John B. Mitchell, expert chief of division.

Respectfully,

SAM. L. ROGERS,  
*Director of the Census.*

Hon. WILLIAM C. REDFIELD,  
*Secretary of Commerce.*

# SPECIAL TABLES OF MORTALITY FROM INFLUENZA AND PNEUMONIA (ALL FORMS).

## SCOPE OF THE REPORT.

It is estimated that 445,000 deaths from the epidemic of influenza occurred in the United States in the last four months of 1918 and about 346,000 of these in the registration area for deaths, in which dwells about 77.8 per cent of the population of the United States.

Data relating to the influenza epidemic, among the civilian population only, have been compiled in considerable detail for the states of Indiana and Kansas and for the city of Philadelphia and are herewith presented, deaths of soldiers, sailors, and marines being excluded. Attention is called to a few of the most striking facts shown by the data, but as all the evidence is not in, no attempt at a thorough analysis has been made.

The epidemic did not end until well into the year 1919, but it has not been found feasible to present at this time any data relating to that year.

The total number of deaths which occurred in Indiana, Kansas, and Philadelphia during the last four months of 1918 was 52,033, which total, however, excludes the deaths of 322 soldiers, sailors, and marines in Indiana, 1,223 in Kansas, and 330 in Philadelphia. Of these 52,033 deaths, 26,926 were certified as primarily due to influenza and pneumonia (all forms), and for 2,260 others influenza and pneumonia (all forms) were given as contributory causes of death. The total number of deaths among the civilian population in these two states and in Philadelphia in the last four months of 1917 was 27,202. Reduced to rates based upon estimated populations, the annual death rate from all causes per 1,000 population for the four-month period of 1918 in Indiana was 20.2 against 12.9 for the corresponding months of 1917, in Kansas 17.5 against 9.7, and in Philadelphia 37 against 15.4.

Estimates of population as of July 1, 1918, have been made especially to permit a more accurate study of this epidemic. The usual arithmetical method was used without allowance for soldiers, sailors, and marines who entered the Army or Navy, or for unusual migrations from one part of the country to another. As 1918 was eight years away from the 1910 census, and as extensive migrations of the population took place before and during the war, it is too much to hope that all of the estimated populations are approximations to the actual populations. Death rates based upon the estimates of populations are consequently far too high in some cases and undoubtedly

far too low in others. In general, however, the estimates of populations are believed to be reasonably good and the death rates, therefore, fairly reliable.

In Indiana and Kansas the death rates from influenza and pneumonia (all forms) as primary causes were for the most part much higher in the cities than in the rural districts, but even in the cities of these two states the rates were very much lower than the rates of Philadelphia. The annual death rate of males from influenza and pneumonia (all forms) as primary causes per 100,000 population for the four-month period was 891 in Indiana, 886 in Kansas, and 2,300 in Philadelphia, while the annual death rate of females was 882 in Indiana, 831 in Kansas, and 2,104 in Philadelphia.

In Kansas the lowest death rates from influenza and pneumonia (all forms) as primary causes for males, and likewise for females, were, for those aged 5 to 9 years, 246 and 309, respectively, per 100,000 population of those ages, while the highest rates for males were for those aged 32 to 34, 2,146 per 100,000 corresponding population and the highest rates for females were for those aged 28, 1,853 per 100,000 corresponding population.

In Philadelphia the lowest death rates per 100,000 corresponding population for males, and likewise for females, were for those aged 10 to 14, 616 and 752, respectively, while the highest rate, 5,925 for males, was for those aged 31, and the highest rate, 5,383 for females, was for those 1 year of age, and the next highest, 4,660, was for those aged 28.

In Indiana the lowest rate for males was for those aged 55 to 59, 326 per 100,000 corresponding population; the next lowest rate, 345, was for those aged 50 to 54, and the third lowest rate, 364, was for those aged 10 to 14, while the highest rate, 3,124, was for those under 1 year, the next highest, 2,445, for those 1 year of age, and the third highest, 1,903, for those aged 29.

For females in Indiana the lowest rate in five-year groups was for those aged 55 to 59, 279 per 100,000 corresponding population, and the next lowest rate, 394, for those aged 10 to 14, while the highest rate, 2,325, was for those under 1 year, the next highest, 2,278, for those aged 1 year, and the third highest, 1,810, for those aged 30.

If children under 5 years of age are excepted, the highest rates from influenza and pneumonia (all forms) as primary causes in five-year groups for males in Indiana, Kansas, and Philadelphia, and for females in Indiana, were from 30 to 34 years, and among

## MORTALITY FROM INFLUENZA AND PNEUMONIA.

females in Kansas and Philadelphia, from 25 to 29 years. These high rates of males aged 30 to 34 years were, respectively, for Indiana, Kansas, and Philadelphia, 1,736, 2,119, and 4,602 per 100,000 male population of these ages, while the highest rate of females 30 to 34 for Indiana was 1,605, and of females 25 to 29 for Kansas and Philadelphia 1,738 and 4,246, respectively, per 100,000 female population of these ages.

The tremendous toll exacted of adults between 20 and 40 is evident from the fact that 14,153 of 26,926 deaths here tabulated as due to influenza and pneumonia (all forms) as primary causes occurred in this 20-year period, or, in other words, 53 per cent of the male deaths and 52 per cent of the female deaths, although the population between 20 and 40 years in Indiana, Kansas, and Philadelphia is only 33 per cent of the total population.

Whether males or females were more seriously affected by the epidemic is still an open question. In fact, the annual death rate for the four-month period for the combined populations of Indiana, Kansas, and Philadelphia from influenza and pneumonia (all forms) as primary and contributory causes was 1,345 per 100,000 population for females and 1,344 for males, although the rate from influenza and pneumonia (all forms) as primary causes only was 1,212 for females and 1,268 for males.

Comparing further the rates of influenza and pneumonia (all forms) as primary causes only, the death rates among the males are higher than among the females at each age period from 15 to 19 and from 29 to 44 in Indiana, in Kansas, and in Philadelphia, while the death rates of females are for the most part higher than those for males in the age periods 4 to 14 and 20 to 28. But it should be pointed out that death rates from influenza and pneumonia as contributory causes of death are in most age periods higher for females than for males, and especially so between the ages of 15 and 44, while, on the other hand, estimates of population have been made without any corrections for the soldiers, sailors, and marines withdrawn from the civil population, so that in some cases estimates of the male population for the draft ages are presumably much too high and the corresponding death rates much too low.

In the absence of estimates for certain elements of the population and to facilitate checking the accuracy of such estimates as were made, percentages are extensively used throughout the report. Proper interpretation of the percentage figures and diagrams presented can only be made by constantly keeping in mind the normal death rates of the various parts of our population at different age periods. To facilitate such interpretation, therefore, a table is here inserted for Indiana and Philadelphia giving the annual death rates by age and sex for the four-month

period from (1) influenza and pneumonia as primary causes, (2) influenza and pneumonia as secondary causes, (3) all other causes, and finally giving normal rates from all causes from graduated data taken from nonepidemic years.

## SINGLE AND MARRIED.

The tabulations of the single and married are given by age and sex, and although the diagrams of the males appear very much like those of the females, the explanation of the higher percentages among the married than among the single is very different for the two sexes.

Generally speaking, normal death rates of single males are higher than the normal death rates of married males, so that if an epidemic affected these two classes equally one would expect diagrams like those here presented, with the percentages of the married well above the percentages of the single.

On the other hand, normal death rates of single females (15 to 44) are much lower than normal death rates of married females (15 to 44), so that if an epidemic affected these two classes of females equally, one would expect diagrams the reverse of those here presented—the single line would be far above the married line. The conclusion is, therefore, that the epidemic exacted a much heavier toll from the married females than from the single females.

As no estimated populations by country of birth of mother are available for Philadelphia, the only calculations made by country of birth of mother are percentages of total deaths by ages. In Philadelphia the percentages were higher for those whose mothers were born in foreign countries than for those whose mothers were born in the United States. The table on this page shows the number and percentage of deaths between the ages of 20 and 44.

The percentages permit some very interesting interpretations. For example, the death rates of white persons having mothers born in Ireland were shown in the 1900 vital statistics to be very much higher than the death rates of those having mothers born in the United States. Later studies based upon 1910 data by statisticians outside of the Bureau of the Census have also shown very much higher rates for those having mothers born in Ireland than for those having mothers born in the United States. It seems only fair to assume, therefore, that the normal death rate of those having mothers born in Ireland was still comparatively high in 1918, and if this assumption is correct the high percentages of total deaths due to influenza and pneumonia (all forms) among those having mothers born in Ireland clearly show that this portion of our population suffered much more severely from the epidemic than did those having mothers born in the United States. Again, if the normal high death rates of the colored of Philadelphia are taken into consideration, the percentages of total deaths due to influenza and

pneumonia (all forms) among the colored indicate that the colored population suffered very severely from the epidemic, especially the children.

NUMBER AND PER CENT OF DEATHS, BY SEX, AND FOR WHITES, BY COUNTRY OF BIRTH OF MOTHER, FROM ALL CAUSES AND FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY AND CONTRIBUTORY CAUSES, IN PHILADELPHIA, FOR THE AGE PERIOD 20 TO 44 YEARS, FROM SEPT. 1 TO DEC. 31, 1918.

[This table excludes the deaths of soldiers, sailors, and marines.]

## DIAGRAMS.

To check the accuracy of the calculated death rates and to construct rough rates when estimated populations were not available, Diagrams 13, 14, 23, 24, and 37 to 40 were drawn. The solid lines in Diagrams 13, 14, 23, and 24 represent death rates based upon estimated populations and the dotted lines rough death rates based upon the assumption that deaths from all other causes except influenza and pneumonia (all forms) as primary causes in the last four months of 1918 represent the normal, that is, the deaths which would have resulted from these other causes in the absence of the epidemic, and upon the further assumption that in Indiana the death rates calculated from graduated data for Indiana taken from nonepidemic years may be regarded as normal rates, which, in the absence of the epidemic, would have held for the last four months of 1918; and that similarly in Philadelphia the death rates calculated from graduated data for Philadelphia taken from nonepidemic years may be regarded as normal rates, which in the absence

of the epidemic would have held for the last four months of 1918.

For Kansas no graduated data were available, so no rough death rates were attempted. These rough death rates were found for Indiana, as follows: Graduated data of 1909, 1910, and 1911 of Indiana were first used to find a set of normal death rates by age and by sex as in the construction of a life table. To make these rates more nearly accord with rates based upon all deaths except influenza and pneumonia (all forms), the percentages of deaths from pneumonia (all forms) to total deaths by age and sex in Indiana in 1910 were calculated and the life table death rates reduced corresponding amounts. [No allowance was made for the influenza deaths in 1910, as this was considered an unnecessary refinement for this rough calculation.] The resulting death rates were now assumed to represent the death rates from all causes, except influenza and pneumonia (all forms) as primary causes in the last four months of 1918, and the rough death rates shown in the diagrams were then calculated from the percentages given in Table 1A.

Presumably, therefore, the higher rates for males of draft ages shown by the dotted lines of the diagram for Indiana are more nearly correct than the rates based upon the estimated populations. Attention is called particularly to the close resemblance of the curve of rough rates to the curve of rates based upon estimated population—two curves which have been constructed by such totally different methods—and the contention is made that this close resemblance greatly strengthens the probability that the population estimates for the most part are reliable.

In Diagram 13 for Indiana males the rates shown between 15 and 34 based upon estimated populations are probably too low, as no allowance was made for the young men who went to war. In Philadelphia, on the other hand, Diagram 23 indicates that no allowance is necessary for males entering the war, the presumption being that migrations of males to Philadelphia counterbalanced the withdrawal of males from Philadelphia to enter the war. This contention is also borne out by preliminary figures of births for the early months of 1919, for, remembering that two of the factors tending to reduce the birth rate in the early months of 1919 were the absence of males in the war and stillbirths due to the epidemic, Philadelphia, in spite of its relatively large number of stillbirths during the epidemic, still shows a very much smaller per cent reduction in recorded births than does Indiana.

Diagrams 39 and 40 of rough death rates of the colored of Philadelphia were constructed from 1909, 1910, and 1911 graduated data of the colored of the 10

original registration states and the District of Columbia to which were applied the percentages of deaths from pneumonia (all forms) in 1910 among the colored of Philadelphia, in the same way, already described, that rough rates were found for Philadelphia and Indiana.

As Philadelphia's population is made up of many nationalities, the question arises whether all of these nationalities were equally affected by the epidemic. In the absence of any 1910 rates for Philadelphia by country of birth of mother and in view of the fact that former studies of the population of other cities and of the registration area by country of birth of mother have all shown the same tendencies of high rates for certain nationalities and low rates for others, experimental diagrams of death rates have been constructed from the percentages given in Table 4. In constructing these diagrams the assumption has been made that death rates calculated for Boston by country of birth of mother for 1910 for all causes except pneumonia (all forms) correspond to death rates from all causes except influenza and pneumonia (all forms) as primary causes in Philadelphia in the last four months of 1918. In computing these Boston rates deaths of nonresidents were deducted and deaths where the countries of birth of mothers were unknown were not distributed. In fact, on many grounds the application of such Boston rates to Philadelphia is open to serious criticism. But in default of better data these experimental diagrams are inserted, as they seem to point very strongly to the existence of greater susceptibility to the disease among some nationalities than among others, and it is hoped that they will direct the attention of investigators to studies along this line. The extremely high rates for those having mothers born in Ireland are particularly noticeable. The diagrams for the colored and total of Philadelphia indicate for the most part higher mortality rates from influenza and pneumonia (all forms) as primary causes for colored children than for white children, but lower rates especially for females for the colored aged 19 to 44 than for white persons of corresponding ages.

#### OCCUPATIONS.

The tabulations by occupations deal with figures too small for the most part to warrant definite conclusions and are published simply in the hope that they may supplement other figures which investigators may obtain.

#### STILLBIRTHS.

To permit comparisons between the number of stillbirths in the epidemic months and normal months, figures are shown for each month of 1918. The large

number of stillbirths in October in Philadelphia clearly points to the epidemic as the cause and indicates that the portions of the population most severely affected were those having mothers born in the United States, in Italy, and in Russia (including Russian Poland), though no rates are possible, as no estimates of population by country of birth of mother are available. In Philadelphia the increase in October stillbirths over the average number of stillbirths recorded for the other 11 months of the year was 103 per cent, the greatest increase (147 per cent) occurring among mothers aged 20 to 24, while mothers aged 25 to 29 had an increase of 117 per cent. These tables of stillbirths clearly show the serious effect of the epidemic upon pregnant women, although the registration of stillbirths is believed to be so incomplete that the figures presented merely indicate this fact without permitting a measure of its degree of seriousness.

In Kansas there were more stillbirths in October than in any other month of 1918, and 24 per cent more than the average of the other 11 months, but in Indiana the October total was exceeded by the totals for March and December and the October total was only 13 per cent greater than the average for the other 11 months. Presumably these differences between Philadelphia and Kansas and Indiana were due to the greater severity of the epidemic in Philadelphia.

#### COMPILATIONS BY GROUPS OF COUNTIES.

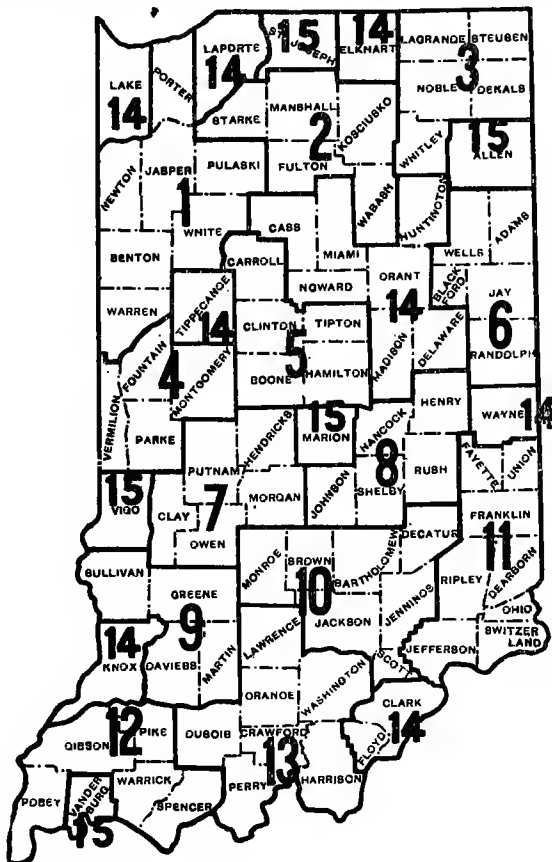

Statistics relating to Indiana and Kansas have been compiled by groups of counties. To have presented statistics relating to the epidemic for each county in Indiana and Kansas would have required a prohibitive number of pages and would have resulted in many tables of small figures having little significance.

The geographer, therefore, has grouped the counties as shown in the maps on the following page, and tables are presented for each of these groups of counties.

## MORTALITY FROM INFLUENZA AND PNEUMONIA.

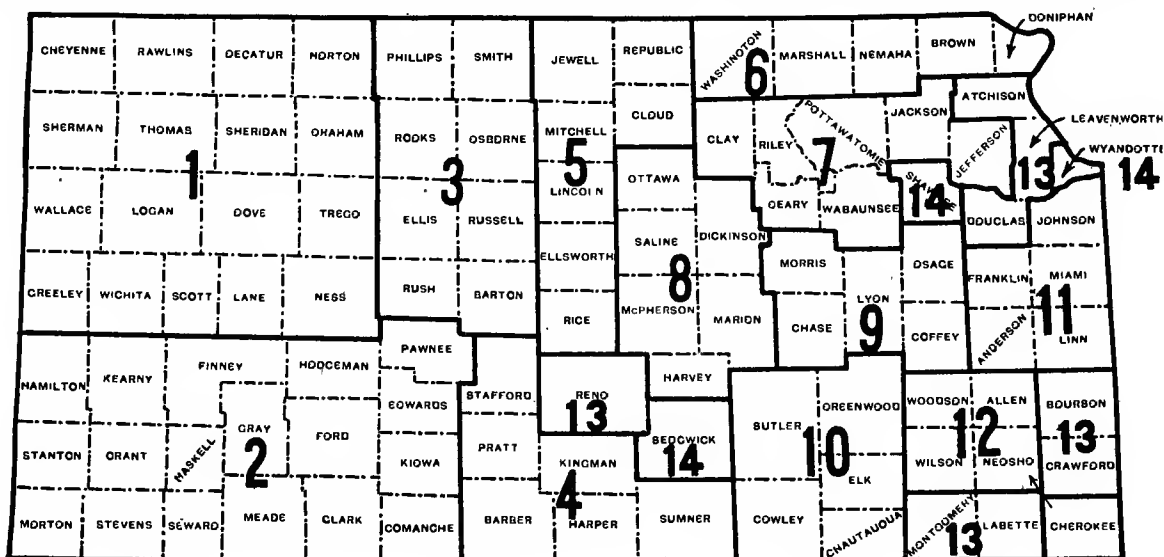

## INDIANA.

NUMBERS 1 TO 13, INCLUSIVE, REPRESENT GROUPS OF COUNTIES NONE OF WHICH HAD A CITY WITH 10,000 OR MORE POPULATION IN 1910. GROUP NO. 14 INCLUDES ALL COUNTIES (EXCEPT ST. JOSEPH COUNTY) WHICH HAD IN 1910 CITIES WITH 10,000 TO 25,000 POPULATION. GROUP NO. 15 INCLUDES ALL COUNTIES WHICH HAD IN 1910 CITIES WITH 25,000 OR MORE POPULATION.

## KANSAS.

NUMBERS 1 TO 12, INCLUSIVE, REPRESENT GROUPS OF COUNTIES NONE OF WHICH HAD A CITY WITH 10,000 OR MORE POPULATION IN 1910. GROUP NO. 13 INCLUDES ALL COUNTIES WHICH HAD IN 1910 CITIES WITH 10,000 TO 25,000 POPULATION. GROUP NO. 14 INCLUDES ALL COUNTIES WHICH HAD IN 1910 CITIES WITH 25,000 OR MORE POPULATION.

Annual death rates of colored are rough rates computed from 1909, 1910, and 1911 graduated data of the colored of the 10 original registration states and the District of Columbia, to which were applied the percentages of deaths from pneumonia (all forms) in 1910 among the colored males of Philadelphia and the percentages in Table 4 of this report.]

DIAGRAM 40.—PHILADELPHIA, FEMALES: ANNUAL DEATH RATE PER 100,000 ESTIMATED POPULATION OF TOTAL AND COLORED FROM INFLUENZA AND PNEUMONIA (ALL FORMS) AS PRIMARY CAUSES, FOR THE PERIOD SEPT. 1 TO DEC. 31, 1918.

[NOTE.—Annual death rates of all females are per 100,000 estimated female population. Annual death rates of colored are rough rates computed from 1909, 1910, and 1911 graduated data of the colored of the 10 original registration states and the District of Columbia, to which were applied the percentages of deaths from pneumonia (all forms) in 1910 among the colored females of Philadelphia and the percentages in Table 4 of this report.]
